

## CLAIMS

1. A drawn film having, as at least one outermost layer thereof, a layer (A) which comprises a copolymer that is made from 4-methyl-1-pentene and ethylene or an  $\alpha$ -olefin, except 4-methyl-1-penten, having 3 to 20 carbon atoms and that comprises 80% or more by mole of 4-methyl-1-pentene and which does not substantially comprise wax or organic silicone compound, wherein the peel area of the film is 50% or more when the film, together with a copper foil surface subjected to roughening treatment, is subjected to heating and pressing treatment.

2. A drawn film having, as at least one outermost layer thereof, a layer (A) comprising a copolymer that is made from 4-methyl-1-pentene and ethylene or an  $\alpha$ -olefin, except 4-methyl-1-penten, having 3 to 20 carbon atoms and that comprises 80% or more by mole of 4-methyl-1-pentene, wherein the thermal coefficient of contraction of the film is 20% or more along the direction in which the film is drawn.

3. A drawn film wherein the drawn film according to claim 1 or 2 is a single layer film of the layer (A) and the film is obtained by monoaxial drawing.

4. A release film, which is the drawn film according to any one of claims 1 or 2.

5. A process for producing a drawn film, comprising the step of drawing, 4.3 times or more, a sheet composed of at least one outermost layer made of a layer (A) which comprises a copolymer that is made from 4-methyl-1-pentene and ethylene or an  $\alpha$ -olefin, except 4-methyl-1-penten, having 3 to 20 carbon atoms and that comprises 80% or more by mole of 4-methyl-1-pentene and which does not substantially comprise wax or organic silicone compound, and a layer (B) which is formed on the layer (A) and comprises polypropylene and/or polyethylene; and the step of peeling the layer (B) of the polypropylene and/or polyethylene of at least one of the outermost layer from the other portions.
